

## **Freebird – Importing a species list**

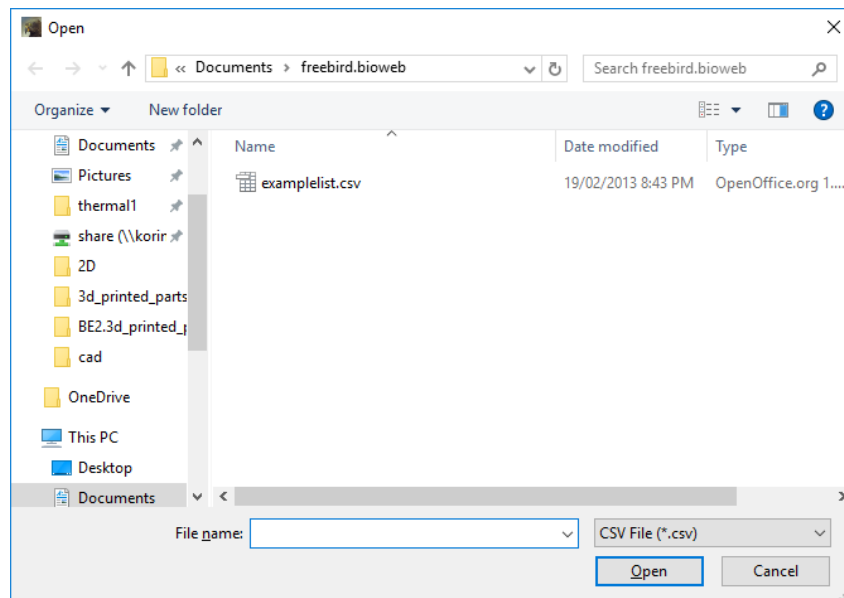

**Note:** If you find you can't open or create a workspace (because it is greyed out) then you probably need to import, or create, a species list. A species list is necessary in order to mark up a spectrogram with actual species.

### **Importing a species list**

From the main menu, choose *Option*, then *Species List* from the drop down menu, and the following dialog box will appear:-

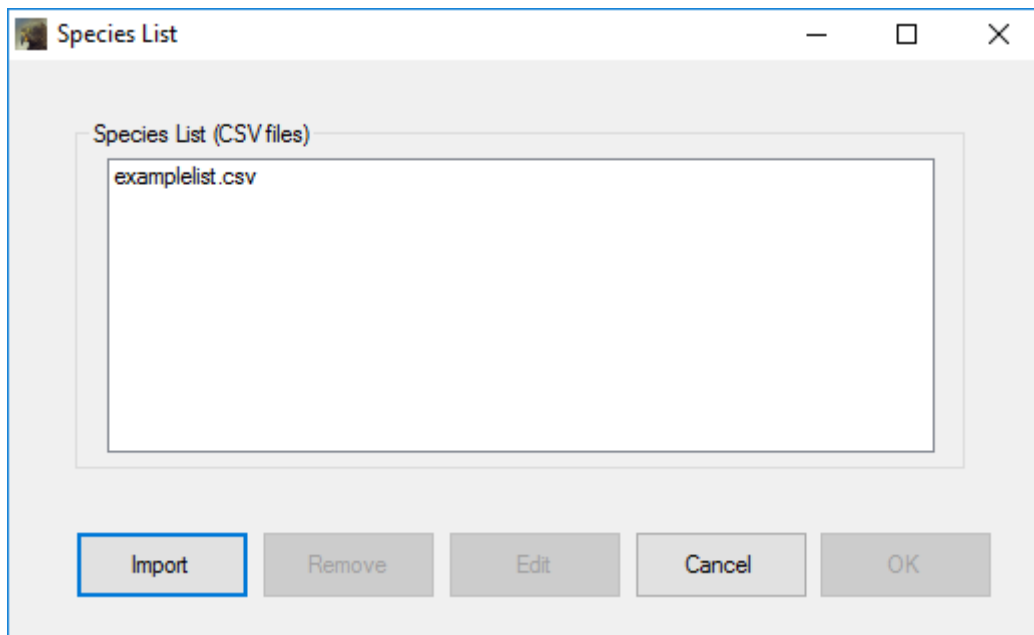

Select the *Import* button (lower left), and navigate the filesystem to find your species list (which is a .csv file)

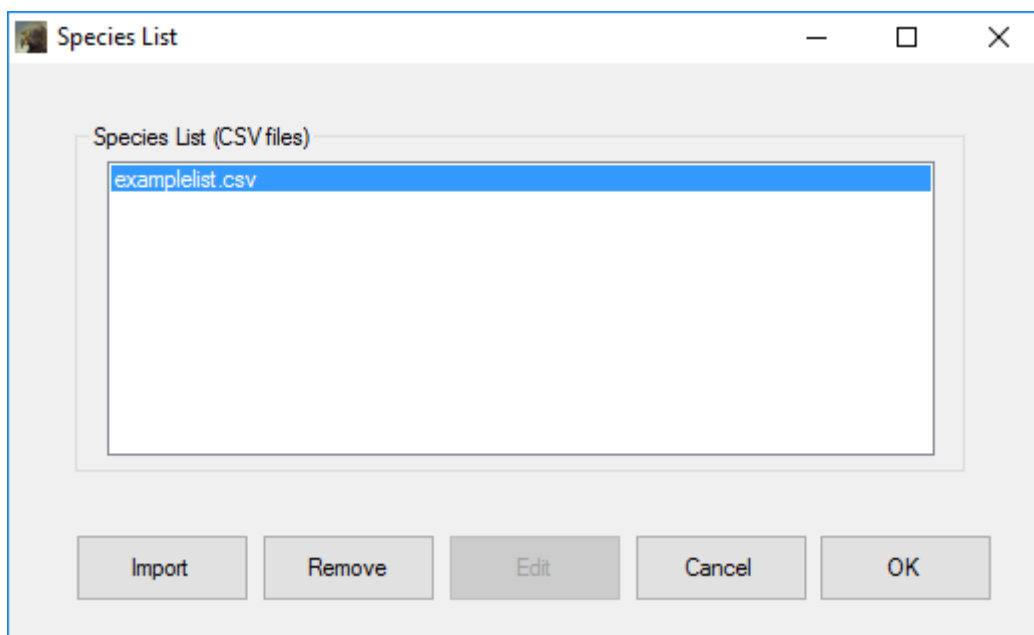

Select the desired .csv file and click *Open*, and it will appear in the Species List dialog box as follows:-

Freebird – Importing a species list

(c) Oceansense Ltd (formerly Freebird Ltd), NZ, 2017

**Important:** Now, once again click on the .csv file that is now in the Species List window

So the OK button goes from greyed out, to active.

Click OK.

The species list has been imported into Freebird, and now you can create a New Workspace.
